SUMMARY

Software engineer who took a product from idea to production alone: founder and sole engineer of JustBook, a booking and payments platform live on web, iOS and Android. Built ride-dispatch, Go microservices on Kubernetes with gRPC, RabbitMQ and Kafka.

EDUCATION

B.S. Computer Science & B.S. Data Science GPA 3.96 / 4.0

Aug 2023 – May 2026

University of Wisconsin–Madison · *Graduated with Distinction, in three years* · *Certificate in Entrepreneurship*

Coursework: Big Data Systems, Honors Algorithms, Databases, AI, Machine Learning, Machine Organization

TECHNICAL SKILLS

Languages: Python, Go, SQL, JavaScript, TypeScript, Java, C++, C, R

Backend & data: Flask, SQLAlchemy, PostgreSQL, REST API design, gRPC, Redis, MongoDB, Kafka, RabbitMQ

Infrastructure: Docker, Kubernetes, GitHub Actions, Prometheus, Grafana, OpenTelemetry, Render, AWS S3

Frontend & mobile: React 19, Next.js, Vite, Capacitor (iOS/Android), React Native, Figma

Testing: pytest, Vitest, Playwright, k6 load testing

Payments & security: Stripe (Connect, Billing, Terminal, Tap to Pay), Twilio, JWT, WebAuthn passkeys, RBAC

EXPERIENCE

Founder & Software Engineer

May 2025 – Present

JustBook · *Booking and payments SaaS* · justbookapp.com · [App Store](#) · [Google Play](#) · [Write-up](#)

- **Took a booking and payments platform from idea to production alone in 15 months**, live on web, iOS and Android: a Flask/PostgreSQL API (633 endpoints, 127 models), a React 19 front end and Capacitor mobile apps.
- **Designed one availability engine for every booking surface** (public site, admin calendar, waitlist) so they can never disagree about a free slot; a constant 5 queries per month view, pinned by tests; published on GitHub.
- **Eliminated double bookings under concurrent load:** reproduced the race with a k6 load test, then serialized all five booking write paths with PostgreSQL advisory locks keyed per branch and day.
- **Made Stripe payments safe to retry:** Connect, Billing and Terminal (card readers, Tap to Pay on iPhone and Android) with replay-safe webhooks and exactly-once guards, so a duplicate event cannot charge twice.
- **Cut the booking-flow read from nine sequential queries to one** (about 0.8 s cold before) with request-scoped memoization and a commit-invalidated cache; query-budget tests fail the build if the count grows.
- **Made tenant isolation impossible to skip:** an AST audit fails the test suite on any unguarded route, so a cross-tenant read cannot reach production; JWT with revocation, TOTP, passkeys and RBAC.

Web Developer & Product Consultant

Mar 2026 – May 2026

NeuroSolis Therapeutics · *Contract* · *Remote*

- **Delivered the investor-facing website end to end** with the founding team, from content structure and visual direction through deployment and DNS, turning complex biotech concepts into clear copy.

IT Help Desk Technician, Level 1 to Lead

Jan 2024 – May 2026

UW–Madison Libraries · *Part-time* · *Madison, WI*

- **Promoted through four levels to Lead within a year**, then ran daily operations across the public computer labs and help desk for a team of student technicians, 29 hours a week alongside a full-time dual degree.

PROJECTS

ride-dispatch Ride-sharing backend in Go microservices

2026

github.com/vramaswamy4/ride-dispatch · [Write-up](#)

- **Built a ride-sharing backend as five Go microservices on Kubernetes**, using gRPC where the caller needs an answer, RabbitMQ where it only needs to announce an event, and WebSockets for live rider and driver updates.
- **Made the driver service stateless** by streaming positions through Kafka (keyed by driver ID) into an idempotent consumer that keeps a Redis geo index, so nearest-driver matching is one GEOSEARCH on any replica.
- **Proved crash-safety instead of claiming it:** durable queues, acks after the work, backoff retries, dead-lettering and idempotent handlers, verified by a chaos test that kills a pod mid-ride and asserts no double-processing.
