## SUMMARY

Founder and sole engineer of JustBook, a booking and payments platform for salons, barbershops, and other appointment businesses, live since August 2026 on web, iOS, and Android. Took it from idea to production alone in 15 months: product, architecture, code, payments, and operations. U.S. permanent resident, no sponsorship required.

## EDUCATION

**B.S. Computer Science & B.S. Data Science · GPA 3.96 / 4.0 · Aug 2023 – May 2026**

University of Wisconsin–Madison · *Graduated with Distinction, in three years* · *Certificate in Entrepreneurship*

**Coursework:** Big Data Systems, Honors Algorithms, Databases, AI, Machine Learning, Machine Organization

## TECHNICAL SKILLS

**Languages:** Python, SQL, JavaScript/TypeScript, Java, C/C++, R

**Backend & data:** Flask, SQLAlchemy, PostgreSQL, Redis, REST, gRPC, Kafka, Spark, Cassandra, HDFS, BigQuery

**Infrastructure:** Docker Compose, Linux, GitHub Actions, Render, Cloudflare Workers, AWS S3/SES, GCP, Sentry

**Frontend & mobile:** React 19, Vite, React Native, Playwright, Vitest, Capacitor (iOS/Android), Figma

**Payments & security:** Stripe (Subscriptions, Connect, Terminal, Tap to Pay), Twilio, JWT, TOTP, passkeys, RBAC

## EXPERIENCE

**Founder & Software Engineer · May 2025 – Present**

JustBook · *Booking SaaS for appointment businesses* · *Sole engineer and operator, live since Aug 2026*

- **Architected the platform and owned every design decision** (76 dated ADRs): the 127-table PostgreSQL data model, the Render + Cloudflare infrastructure, every screen designed in Figma before it was built, and the booth-rental model, where each renter gets their own tenant linked to the venue rather than nested under it.
- **Designed the availability engine:** grid-aligned slot generation over per-stylist conflict indexes (appointments, holds, time-off, buffers), shared by the public page, admin calendar, and waitlist.
- **Eliminated double bookings** by re-validating every booking path under a per-slot Postgres advisory lock; a stale cache yields a 409 at worst.
- **Cut booking-flow latency from ~0.8 s to one query** on warm hits with request-scoped memoization, an event-invalidated per-worker TTL cache, and a CI query-budget test that blocks regressions.
- **Built exactly-once Stripe webhook handling** across Subscriptions, Connect, and Terminal (S700 and M2 readers, Tap to Pay on iOS and Android), with idempotency keys on every money mutation and derived settlement state.
- **Enforced tenant isolation as a build invariant:** server-side scoping on every route, one generic access-control guard, and 19 CI guards that fail on unguarded routes, contract violations, or leaked secrets.
- **Operated the platform end to end:** ~340K lines, 632 endpoints, 5,400+ tests, zero-downtime migrations, restore-drilled backups.

**Web Developer & Product Consultant · Mar 2026 – May 2026**

NeuroSolis Therapeutics · *Contract* · *Remote*

- **Built and deployed the investor-facing website** with the founding team; set up their Zoho email and domain.

**IT Help Desk Technician, Level 1 → Lead · Jan 2024 – May 2026**

UW–Madison Libraries · *Part-time* · *Madison, WI* · *Promoted through 4 levels within a year*

- **Led daily operations** across public labs and the help desk (Active Directory, Bomgar, InfoBlox, Redmine), 29 hrs/week alongside a full-time dual degree.

## PROJECTS

**Big Data Systems (CS 544): eight graded systems projects · Fall 2025**

- **Built a replicated gRPC lookup service** with LRU-cached HTTP front-ends that survives a container failure, and a SQL→HDFS Parquet pipeline (WebHDFS, PyArrow) that keeps serving through DataNode loss.
- **Streamed MySQL rows through Kafka** to partition-assigned consumers writing Parquet to HDFS with exactly-once semantics; wrote a Cassandra gRPC weather server tuned for write availability.
- **Analyzed data with Spark** RDD/DataFrame/SQL and trained a Spark ML decision tree; built a GCS → Dataform → BigQuery geo pipeline and a multithreaded word-count benchmark (CSV, Parquet, Arrow).

**Minirel DBMS (CS 564) · Spring 2026**

- **Implemented database internals in C++ from scratch:** an LRU buffer manager and a heap file manager.
